BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

RESULT 1 US-09-087-232A-13

Patent No. 6153431

GENERAL INFORMATION:

APPLICANT: Quillor

TITLE C.

TITLE OF INVENTION: HUMAN IMPORTATION OF INVENTION: VARIANTS NUMBER OF SEQUENCES: 23

HUMAN IMMUNODEFICIENCY VIRUS CO-RECEPTOR VARIANTS ASSOCIATED WITH RESISTANCE TO V.

TO VIRUS INFECTION

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is stimulated by MIP-1 alpha, MIP-1 beta or RANTES chemokines, but not by monocyte chemoattractant protein 1 (MCP-1), MCP-2, MCP-3, interleukin-8 (IL-8) or growth related gene product alpha (GRO alpha) chemokines. Active CCR-5 is also a receptor of human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2) CCR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Active

                                                                                                                                                                                                                                                                                                    This polypeptide sequence comprises novel human chemokine receptor 88C, a 6 protein coupled receptor that is involved in leukocyte trafficking. Its amino sequence was deduced from a cDNA clone (AAT85161) isolated from a macrophage library. It shows 62% identity to CCCRR1. Chemokine receptor 88-2B (see AAW27124) has also been identified. 88C and 88-2B receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intracellular compains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G protein binding, and are potentially potentially useful in the treatment of atherosise rheumatod arthritis, tumours, asthma, viral infection, AIDS, inflammatory conditions, pathological immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding chemokine receptors 88-2B and to modulate leukocyte trafficking, e.g. for treatment of inflammation, tumours, viral infections, autoimmune disc

An Ala127Ley variant (see W238340 of CCR5 was also identified. The susceptibility of human macrophages to HIV infection depends on cell surface expression of CD4 and CCR5. CCR5 is a member of the 7-transmembrane superfamily of G-protein coupled cell surface molecules. It plays an essential role in the membrane fusion step of infection by some HIV isolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that coexpress human CD4 and CCR5 provides valuable tools for research of HIV infection. Antibodies that bind to CCR5, CCR5 variants, and CCR5-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage

                                                                                                                                                                                                                                                                                                                                                                                                                                                 (M-tropic) strains of HIV-1. The invention relates to the identification of a CCR5 variant (see AAW88231), designated CCR5m303, comprising the first two transmembrane domains of wild-type CCR5, but lacking transmembrane domains 3-7. The presence of the CCR5m303 variant with the wild type CCR5 allele shows a positive correlation with resistance to infection with M-tropic HIV-1 correlation and may indicate slower progression of the disease. The detection of CCR5 variants may be used to identify individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to AIDS. Probes and primers (see AAV84127-36) are provided for use in diagnostic methods for detecting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCR5 variant into the cell, thereby reducing the number of functional CCR5 molecules present on the cell surface.
                                                                                                                                                                                                                                                                                                                                                                             Query Match

where the (cardio)vascular, lymphatic, respiratory, nervous, digestive, endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives which have cytostatic, antiinflammatory, antiasthmatic, immunosuppressive, dermatological, antirheumatic, antiarthritic. Chemokines act on specific tumor and inflammatory cells through a constellation of chemokine receptors (CR), which control migration and proliferation of these cells. AA680045-AA680128 represent human chemokine This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in disease. (A) are used for the diagnosis of tumors (especially colorectal or prostatic), organ rejection, inflammation and autoimmune diseases. Also inhibitors of (I) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthma or chronic bowel inflammation), or autoimmune diseases (rheumatoid arthritis or lupus), Sequence used A ç illustrate the method of the invention.

07-FEB-2001;
The present sequence is that of human HIV-1 co-receptor CCR5. Amino acids 2-18 in the N-terminal region of CCR5 comprise an HIV-gpl20-binding site that determines the specificity of the interaction between CCR5 and HIV-1 gpl20. Post-translational sulfation of the tyrosine residues in the CCR5 N-terminus is required for gpl20 binding and may critically modulate the susceptibility of target calls to HIV-1 infection in vivo. The invention provides claimed sulfated peptides (see AAB82947) that are based on the CCR5 N-terminal region and which are effective for inhibiting HIV-1 binding to CCR5. These peptides are used in claimed methods of inhibiting HIV infection of CD4+ cells, of preventing CD4+ cells from becoming infected with HIV, of treating

The method is used to identify an agent capable of modulating the interaction of CCR5 with gp120. An agent identified by the method is used to prepare a pharmaceutical composition for the treatment of a disease or condition associated with CCR5 and gp120 interaction, to treat a subject with a disease or condition associated with CCR5 and gp120 interaction, and for preparing a pharmaceutical for treating human immunodeficiency virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput screening, and detects interaction of gp120 with cells expressing only
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            capable of modulating the interaction of chemotactic chemokine (CCR5) with gp120, comprising incubating the against the agains

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transformed and HIV LTR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       contains a gene encoding CD4, a construct encoding a reporter gene under the regulation of an human immuno deficiency virus (HIV) long terminal repeat (LTR) and that has been transduced with a vector encoding a human chemokine receptor (CKR) where the CD4 and the CKR are present on the cell surface of transformed mammalian cell. The invention is useful for identifying drugs or antibodies that interfere with the translocation of HIV into transformed mammalian cell or for identifying a human chemokine receptor that facilitates the infection of a particular HIV strain into the transformed mammalian cell. Compounds identified can be used to treat cellular dysfunction and to prevent or combat HIV infection who recent companies the infection and to prevent or combat HIV infection who recent companies the infection and to prevent or combat HIV infection who recent companies the infection and to prevent or combat HIV infection who recent companies the infection and to prevent or combat HIV infection who recent companies the infection and to prevent or combat HIV infection who recent to the recent of the infection and to prevent or combat HIV infection who recent to the recent of the infection and the recent of the infection and the recent of the recent of the infection and the recent of the infection of the infection and the recent of the infection of the infection and the infection of the infection of the infection and the infection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                identified can be used to treat cellular dysfunction and to prevent or combat HIV infection. The present sequence is a human chemokine receptor (CKR), CC-CKR-5 related protein. CC-CKR-5 is the principal cofactor for entry mediated by the envelope glycoproteins of primary macrophage-tropic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2001-417127/44.

The specification also describes an isolated polynucleotide comprising a nucleotide sequence which is a polynucrphic variant of the reference CCR5 gene sequence and comprises an isogene defined by a haplotype described in the specification and its encoded polypeptide. The methods of the claventh of the specification and its encoded polypeptide. The methods of the claventh of the specification of the gene. The CCR5 associated with abnormal expression or function of the gene. The CCR5 isogenes and the screened compounds are useful for treating human clammondeficiency virus (HIV)-1 infection and the progression to acquired immunodeficiency syndrome (AIDS). The invention has antiviral applications. The specification describes genotyping the CCR5 gene of an individual; predicting a haplotype pair for the CCR5 gene of an individual; identifying an association between a trait and a haplotype or CC individual; if the CCR5 gene. The specification describes a composition comprising a genotyping oligonucleotide for detecting a CCR5 polymorphism; a recombinant non-human organism transformed with CCR5 polymorphism; a recombinant non-human organism transformed with CCR5 colymorphism; a recombinant non-human organism transformed for the CCR5 colymorphism; a recombinant non-human organism transformed for detecting a CCR5 polymorphism; a recombinant non-human organism transformed for the CCR5 colymorphism; a recombinant non-human organism transformed for the CCR5 colymorphism; a recombinant non-human organism transformed for the CCR5 colympication detecting the CCR5 polympication and a method for screening drugs targeting the CCR5 polympication and a method for screening drugs targeting the CCR5 polympication and a method for screening drugs targeting the CCR5 polympication and a method for the CCR5 polympication and a metho
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of a polypeptide encoded by the human chemokine (C-C motif) receptor 5 (CCR5) gene of the invention (see ABA97318, ABA97319). The specification describes haplotyping the CCR5 gene of an individual by determining if the individual has one of the CCR5 haplotypes or haplotype pairs fully defined in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Choi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo

The invention relates to a method for identifying a binding compound for CC chemokine receptor 5 (CCR5). The method involves screening a library of test molecules (particularly peptides) with immobilised CC and then identifying those molecules which bind. The invention also relates to CCR5-binding molecules identified using the method of the invention, methods for identifying consensus motifs for CCR5-binding invention, methods for identifying consensus motifs for CCR5-binding

CCR5

Identifying CC chemokine receptor 5 binding compound for treating comprises binding a molecule from library to a molecule having bin property corresponding to CCR5 and identifying bound molecule -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     methods for determining the relative binding affinity of a test molecule to CCR5 and a computer aided drug screening assay that utilises the three-dimensional structure of CCR5. Compounds identified using the methods of the invention are useful for treating or preventing HIV (human immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention may also be used to identify agonists or antagonists of the interaction of CCR5 with its natural ligand, and to determine a binding motif for
WPI;

The invention provides isolated nucleic acid sequences that encode rabbit CC prostaglandin (PG) E2EP3 receptor, human PG E2EP2 receptor, human CC chemokine receptor CCR-5, human ss2 adrenergic receptor, rat renal outer meduliary potassium ion channel protein or human small G-protein rho, CC together with deduced protein sequences. Also provided is a method for the production of eukaryotic proteins by culturing bacteria transformed CC with vectors containing the above nucleic acid sequences or a nucleic caid (I) that comprises: (i) first sequence that encodes either a comprising at least three positively charged amino acids, or a containing protein, or a lambda phage repressor protein, placed upstream CC of, and in frame with, (ii) a sequence encoding a protein. (I) are used CC proteins, G-protein coupled receptors or ion-channel proteins, in CC bacteria. These proteins are useful for blochemical or structural contingency as therapeutic agents; in diagnostic and screening assays and as antigens for use in vaccines, and for raising antibodies that are useful cas immunchistic chamical markers are for or the proteins.
                                        as immunohistochemical markers, e.g. for orphan receptors o
channels. Antibodies raised against the chemokine receptor
used (when administered as antiserum or generated in vivo)
entry of human immune deficiency virus (HIV) into cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 49-53; 81pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preventing HIV infection

                                                                                                                                                   from an isolated CDNA clone (see AAT76919). The conservative variation should not affect the activity of CCRS. The susceptibility of human macrophages to HIV infection depends on cell surface expression of CD4 and CCR5. CCRS is a member of the 7-transmembrane superfamily of 6-protein coupied cell surface molecules. It plays an essential role in the membrane fusion step of infection by some HIV isolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that coexpress human CD4 and CCR5 provides valuable tools for research of HIV infection. Antibodies that bind to CCR5, CCR5 variants, and CCR5-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage
                                                                                                                                                                                                                                                                                                                                                         fusion

                                                                                                                                                                                                                                                           The invention relates to G protein-coupled receptors (GPCRs) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists are useful as therapeutic agents for diseases or disorders agonists agonists are useful as the disorders agonists agonists are useful as the disorders agonists are useful as the disorders agonists agonists agonists are useful as agonists 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying agonists of G protein-coupled receptors (GPCRs) for use disease treatment; comprises contacting candidate compounds with versions of GPCRs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-APR-2000; 2000US-195747P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; G protein-coupled receptor; GPCR; non-endogenous;
constitutively activated GPCR; agonist; disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC library of test molecules (particularly peptides) with immobilised CCR5, cand then identifying those molecules which bind. The invention also crelates to CCR5-binding molecules identified using the method of the clivention, methods for identifying consensus motifs for CCR5-binding peptides, a transfer vector encoding tagged CGR5, a computer-aided methods for determining the relative binding affinity of a test molecule to CCR5 and a computer aided drug screening assay that utilises the cCR three-dimensional structure of CCR5. Compounds identified using the computer aided drug screening assay that utilises the cCR methods of the invention are useful for treating or preventing HIV CC (human immunodeficiency virus) infection or AIDS (acquired immunodeficiency syndrome) in a patient. The methods of the invention CC may also be used to identify agonists or antagonists of the interaction CC CCR5. The present sequence represents a naturally occurring variant of human CCR5 in which there is a glutamine, rather than a leucine, at

                                                                                                                                                                                                                                                                                                                                                                                   pheumocytis carinii pneumonia or Raposi's sarcoma or defective or disordor may also be an infection disease (e.g. a viral infection such as an early stage HTV infection, a cytomegalovirus infection, or a serior and infection, an autoimmune disease (e.g. rheumatoid arthritis) or neurodegenerative disorder. The disease or disorder may be associated with aberrant CCR5 syrression, lack of CCR5 function. Aberrant CCR5 viral infection is used as a food additive or preservative to increase or decrease storage capabilities. CCR5 HDGNR10 DNA are useful for chromosome identification and in gene therapy. CCR5 HDGNR10 DNA, protein, antibodies, agonists and antagonists are also useful in the disease, multiple sclerosis, rheumatoid arthritis and ulcerative consisting immune disorders (Addison's disease, multiple sclerosis, rheumatoid arthritis and ulcerative.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
